

Computer Networking : Principles, Protocols and Practice, 2nd edition

Computer Networking

Principles
Protocols
and
Practice

This is an unpolished draft of the second edition of this ebook. If you find any error or have suggestions to improve please create an issue via <https://github.com/obonaventure/cnp3/issues/new>

The development of this edition of the textbook is carried out on [github](#)

The source code of the entire textbook is written in [reStructuredText](#) and uses several [sphinx](#) features. You can browse it from [github](#)

Preface

[About the author](#)

Part 1: Principles

Connecting two hosts

[The physical layer](#)

[The datalink layer](#)

[Framing](#)

[Recovering from transmission errors](#)

[Reliable data transfer on top of an imperfect link](#)

[Go-back-n and selective repeat](#)

Building a network

[The datagram organisation](#)

[Computing forwarding tables](#)

[Flat or hierarchical addresses](#)

[Dealing with heterogeneous datalink layers](#)

[Virtual circuit organisation](#)

[The control plane](#)

[Distance vector routing](#)

[Link state routing](#)

Applications

The transport layer

[Transport layer services](#)

[The connectionless service](#)

[The connection-oriented service](#)

[The request-response service](#)

[The transport layer](#)

[Connectionless transport](#)

[Connection establishment](#)

[Data transfer](#)

[Connection release](#)

Naming and addressing

[Benefits of names](#)

Sharing resources

[Sharing bandwidth](#)

Network congestion**Distributing the load across the network****Medium Access Control algorithms****Static allocation methods****ALOHA****Carrier Sense Multiple Access****Carrier Sense Multiple Access with Collision Detection****Carrier Sense Multiple Access with Collision Avoidance****Deterministic Medium Access Control algorithms****Congestion control****Congestion control in a window-based transport protocol****The reference models****The five layers reference model****The Physical layer****The Datalink layer****The Network layer****The Transport layer****The Application layer****Reference models****The TCP/IP reference model****The OSI reference model****Network security****Threats****Cryptographic primitives****Cryptographic protocols****Key exchange****Part 2: Protocols**

The application layer**The Domain Name System****Electronic mail****The Simple Mail Transfer Protocol****The Post Office Protocol****Remote login****The secure shell (ssh)****The HyperText Transfer Protocol****Remote Procedure Calls****Encoding data****Reaching the callee****Transport Layer Security****The TLS handshake****The TLS record protocol****Securing the Domain Name System****Internet transport protocols****The User Datagram Protocol****The Transmission Control Protocol****TCP connection establishment****TCP reliable data transfer****Segment transmission strategies****TCP windows****TCP's retransmission timeout****Advanced retransmission strategies****TCP connection release****The Stream Control Transmission Protocol****SCTP segments****Connection establishment****Reliable data transfert****Connection release****Congestion control**

Controlling congestion without losing data**Modeling TCP congestion control****The network layer****IP version 6****IPv6 addressing architecture****IPv6 packet format****ICMP version 6****The IPv6 subnet****Interactions between IPv6 and the datalink layer****Routing in IP networks****Intradomain routing****RIP****OSPF****Interdomain routing****The Border Gateway Protocol****The BGP decision process****BGP convergence****Datalink layer technologies****The Point-to-Point Protocol****Ethernet****Ethernet Switches****The Spanning Tree Protocol (802.1d)****Virtual LANs****802.11 wireless networks****Appendices**

Glossary**Bibliography****Indices and tables**
